PHARMACEUTICAL COMPOSITIONS CONTAINING COMPOUNDS
WITH ACTIVITY FOR THE ENHANCEMENT OF ABSORPTION OF
ACTIVE INGREDIENTS

5 The invention described herein refers to pharmaceutical compositions, to the use of compounds as agents with activity for the enhancement of absorption of active ingredients and to specific compounds, all according to the general sections of claims 1, 2, 5, 6 and 10 hereinafter.

The problems related to percutaneous absorption of active ingredients in
10 topical and transdermal pharmaceutical presentations (drug delivery systems) is known and has been the subject matter of patents [1]

Percutaneous absorption: mechanisms-methodology-drug delivery, 2 Ed.,
Bronaugh Maibach, MARCEL DEKKER INC.

Among the most significant examples reported in scientific literature it is
15 possible to mention the enhancing activity of decylmethylsulfoxide in increasing percutaneous absorption of idoxuridine [2] Touitou, E. (1988), Int. J. Pharm. 43:1. The effect of dodecylazacycloheptan-2-one (Laurocapram, Azone) in enhancing absorption of various molecules was investigated by Stoughton [3] Stoughton, R. B. (1982), Arch. Dermatol.

20 118: 474 and by Sugibayashi [4] Sugibayashi, K., Hosoya, K. Morimoto, Y., and Higuchi, W. I. (1985), J. Pharm. Pharmacol. 37: 578.

Substances made available on the market and initially used in fields other than the pharmaceutical sector, subsequently proved to be of remarkable

importance also for the pharmaceutical industry. Among these, we can find the Perfluoropolyether class of compounds (PFPE) [5] obtained by polymerization of hexafluoropropene with oxygen activated by UV radiation and subsequent treatment to obtain a cosmetic product [6] as an
5 excipient for preparations used in the manufacture of products with a barrier effect [7].

SUMMARY OF THE INVENTION

The following invention consists in the use of PFPE to enhance absorption
10 of pharmacologically active ingredients in topical pharmaceutical presentations and/or in transdermal formulations (drug delivery systems) containing mixtures of at least one active ingredient for the enhancement of absorption.

These compounds, if included in pharmaceutical presentations containing
15 an association or at least one active ingredient, can modify the permeating capacity of the active ingredients through the skin, demonstrating a surprising and unexpected capacity to promote the penetration of the active ingredient.

In accordance with the first aspect of the invention, inclusion of a quantity
20 of PFPE may be applied in traditional topical formulations such as, for example, but not limited to: creams, liquid emulsions, ointments, lotions, microemulsions, foams, gels, aspersion powders; and in transdermal formulations (drug delivery systems).

The term PFPE means molecules with a chemical structure

with molecular weights between 650 and 6250,

C.A.S. name: 1-Propene,1,1,2,3,3,3-hexafluoro-,oxidized and polymerized

C.A.S. number: 69991-67-9

Surprisingly, it was found that inclusion of a quantity of PFPE at

- 10 concentrations between 0.01% w/w and 60% w/w, in topical and/or transdermal (drug delivery systems) formulations, increases the percutaneous absorption of active ingredients by over 5-20 times their normal value, thus enabling improved absorption and optimization of their systemic effects through suitable pharmaceutical presentations.

15

DETAILED DESCRIPTION OF THE INVENTION

Comprehension of the invention is facilitated by the description of a number of assessments on the percutaneous absorption of certain formulations containing different active ingredients.

- 20 **Example A** illustrates the increase in permeability by approx. 10 times of a formulation containing Troxerutine and 3% PFPE as compared with that of a reference formulation.

Example B demonstrates the correlation between PFPE concentration and percutaneous absorption of formulations containing Nimesulide and increasing concentrations of PFPE.

Example C contains a comparison of the permeation speed of

- 5 formulations containing non-steroidal antiinflammatory drugs versus formulations to which 3% PFPE has been added.

Example A

- Verification of the percutaneous absorption of TROXERUTINE through pig skin using various formulations containing different types of absorption
10 enhancers. In particular, this involved investigation of the release of TROXERUTINE from formulations containing PFPE, Nor-chenodeoxycolic acid and transcutol, versus a reference formulation.

Experimental section:

- Apparatus: Franz Cells (manufacturer: Crown Glass Company Inc., New
15 Jersey)

- Franz diffusion cells are one of the main systems used for the investigation of ex-vivo permeation. This study involved the use of three cells each with a 9 mm diameter donor compartment corresponding with a diffusion area of 64 mm².
20 The receptor compartment has a capacity of 4.8 ml. The receptor chamber is heated to 37°C±1.

Test system: HPLC, Gilson, Mod. 305 with Spectra Physics detector, Spectra 200 Mod.

Preparation of the skin

The pig skin samples were taken from the internal ear of pigs that had just been sacrificed.

- 5 The samples were soaked in buffer solution at pH 7.4 for 24 hours at 4°C. The sections of connective tissue and muscle were subsequently removed from the skin and the sample was cut into 2x2 cm squares.

The skin samples were stored at -20°C.

HPLC Operating Test Conditions

- 10 Column: KP 18, 5 micron Licrospher 100
- Mobile phase: 20% acetonitrile 80% phosphate buffer at pH 6.6
- Flow: 1 ml/min
- Pressure: 1.52 Kpsi
- Wavelength: 245 nm
- 15 RT: 8.51

Procedure

The pig skin is placed between the donor compartment and the receptor chamber with the external skin surface facing the upper compartment. The test formulation is placed inside the donor compartment.

- 5 The receptor chamber is filled with a phosphate buffer solution at pH 7.4 and at intervals between 0.5 and 8 hours, 2 ml of solution are drawn from this chamber. When each sample is taken fresh buffer solution heated to 37°C is added in order to replenish the initial volume. The samples are then tested using a HPLC method. Each test is repeated three times.

10 Results

The results on percutaneous absorption are summarized in the table below

8	12,042	1,090	714.6	1,434.90

Conclusions

- Formulations B, C, D did not show any difference in absorption, whilst at the eighth hour, formulation A containing PFPE, demonstrated a degree of absorption that was about 9-10 times greater than that of reference formulation D.
- 15

Conclusions

Formulations B, C, D demonstrated an increasing capacity to permeate the skin; this permeating capacity is correlated with the increasing percentage content of PFPE.

5 **Example C**

Verification of absorption after 8 hours, of topical formulations containing antiinflammatory drugs versus formulations which also contain 3% PFPE, through pig skin, using Franz cells, as described in Example A.

Active ingredient contained in the topical formulation	mcg of permeated active ingredient after 8 hours	
	Base formula	Base formula+3% PFPE
Ketoprofen	0.64	5.33
Diclofenac Sodium	1.82	8.66
Ibuprofen	0.21	6.84
Etodolic Acid	0.53	9.93

- 10 The invention is characterized by the claims at the end of this description. According to the invention the pharmaceutical compositions contain, apart from one or more active ingredient(s), between 0.01 and 60% w/w of the compounds of formula I

with n and m > 18 and < 46 and with molecular weights between ~600 and ~8000, as compounds with activity for the enhancement of active ingredient absorption.

Such pharmaceutical compositions may also contain between 0.01 and 5 20% w/w of Phosphatidylcholine, the compositions preferred are those with 0.1 to 30% w/w of the compounds of formula I with n and m > 24 and < 36 and with molecular weights between 1000 and 4000 and with 0.1 to 10% w/w of Phosphatidylcholine.

They may also contain other compatible ingredients that are present in the 10 form of creams, emulsions, ointments, lotions, foams, gels and transdermal formulations.

The invention also includes the use of the compounds of formula I

with n and m > 18 and < 46, preferably > 24 and < 36, and with molecular weights between ~600 and ~8000, preferably between 1000 and 4000, in pharmaceutical compositions for topical external or internal use for the enhancement of absorption of active ingredients through the derma, cutis, 20 mucosa, rectum, vagina and urethra, with or without Phosphatidylcholine.

In particular, such use regards active ingredients that have anabolic, analgesic, androgenic, anesthetic, anorectic, anthelmintic, antiallergic, antiamebic, antiandrogenic, antianginal, antiarrhythmic,
